

Scoring physics quantities [I]

Introduction to built-in estimators

Fluence, a misunderstood fundamental quantity

3D distributions (**USRBIN**) & 1D-2D plots

FLUKA Scoring & Results - Estimators

- It is said that Monte Carlo (MC) is a “**mathematical experiment**”
The MC equivalent of the result of a real experiment (*i.e.*, of a **measurement**) is called an **estimator**
- Just as a real measurement, an estimator is obtained by sampling from a statistical distribution and has a **statistical error (and in general also a systematic one)**
- There are often several different techniques to measure the same physical quantity: in the same way **the same quantity can be calculated using different kinds of estimators**
- FLUKA offers **numerous different estimators**, *i.e.* directly from the input file the users can request scoring for various quantities of interest
- As **built-in estimators** are implemented in a correct and complete manner, users are strongly encouraged to **use them** with respect to user-defined scorings
- For additional requirements, **FLUKA user routines** are provided (not covered here)

Built-In and User Scoring

- Several **pre-defined estimators** can be activated in FLUKA.
- One usually refers to these estimators as “**scoring**” capabilities
- Users have also the possibility to build their own scoring through **user routines**. However,
 - **Built-in scoring** covers most of the **common needs**
 - **Built-in scoring** has been **extensively tested**
 - **Built-in scoring** takes **biasing weights automatically into account**
 - **Built-in scoring** has **refined algorithms** for track subdivision (apportioning)
 - **Built-in scoring** comes with **utility programs** that allow to evaluate statistical errors
- Standard scoring can be adapted by means of simple **user routines** (**fluscw.f**, **comscw.f**) to be activated via **USERWEIG** card

Definitions

- N : number of identical particles
- N_0 : number of atoms per unit volume
- λ : **mean free path**, *i.e.* average distance travelled by a particle in a material before an interaction. It depends on the material, particle type and energy
- l : **total distance travelled**
- v : **average particle velocity**

Cross Section

- $\Sigma[cm^{-1}] = 1/\lambda[cm]$: **macroscopic cross section**, *i.e.* probability of interaction per unit distance. It depends on the material, particle type and energy
- $\sigma = \frac{\Sigma}{N_0} = \text{atom effective area}$, [$barn = 10^{-24}cm^2$] : **microscopic cross section**, *i.e.*
 - the **area of an atom weighted with the probability of interaction** (hence the name “cross section”)
 - or the **probability of interaction per unit length, with the length measured in atoms/cm²** (the number of atoms contained in a cylinder with a 1 cm² base)
- Microscopic and macroscopic cross sections have a similar physical meaning of “probability of interaction per unit length”, with length measured in different units. Thus, the number of interactions can be obtained by multiplying both by the corresponding particle track-length

Reaction Rate and Fluence

- $R = \Sigma \Phi V$: number of reactions in a given time interval inside the volume V
(where Φ is the fluence and the product $\Sigma \Phi$ is integrated over energy or velocity)
- $\dot{R} = N \frac{dl}{dt} \Sigma = N v \Sigma$: **reaction rate**
- $\frac{d\dot{R}}{dV} = \frac{dN}{dV} v \Sigma = n(\mathbf{r}, v) v \Sigma$: reaction rate inside the volume element dV
- $\Phi(\mathbf{r}, v) = n(\mathbf{r}, v) dl$, $[cm^{-2}]$: **fluence**, *i.e.* time integral of the flux density
- $\dot{\Phi}(\mathbf{r}, v) = n(\mathbf{r}, v) v$, $[cm^{-3} cm s^{-1}] = [cm^{-2} s^{-1}]$: **fluence rate** or **flux density**
- Fluence is expressed in **particles per cm^2** but in reality it represents the **density of particle tracks**
 $[cm / cm^3]$

Fluence estimation

- **Track length** estimation (**USRTRACK**) :

$$\dot{\Phi}(v) dt = n(v) v dt = \frac{dN(v)}{dV} \frac{dl(v)}{dt} dt = \lim_{\Delta V \rightarrow 0} \frac{\sum_i l_i(v)}{\Delta V}$$

- **Collision density** estimation (**USRCOLL**) :

$$\dot{\Phi}(v) = \frac{\dot{R}(v)}{\sigma(v) N_o \Delta V} = \frac{\dot{R}(v)}{\Sigma(v) \Delta V} = \frac{\dot{R}(v) \lambda(v)}{\Delta V}$$

in vacuum (any low-density material)
it does not work (well)

FLUKA Scoring & Results

What? Energy deposition, and derivatives (dose), fluence or current versus energy, angle or other kinematical variables, time, DPA, activity...

Where? In regions, across boundaries, on region-independent grids

When?

At the end of each cycle

At each event

Output? Files `inpnnn_fort.##` where `##` is the logical unit number chosen by user

Results?

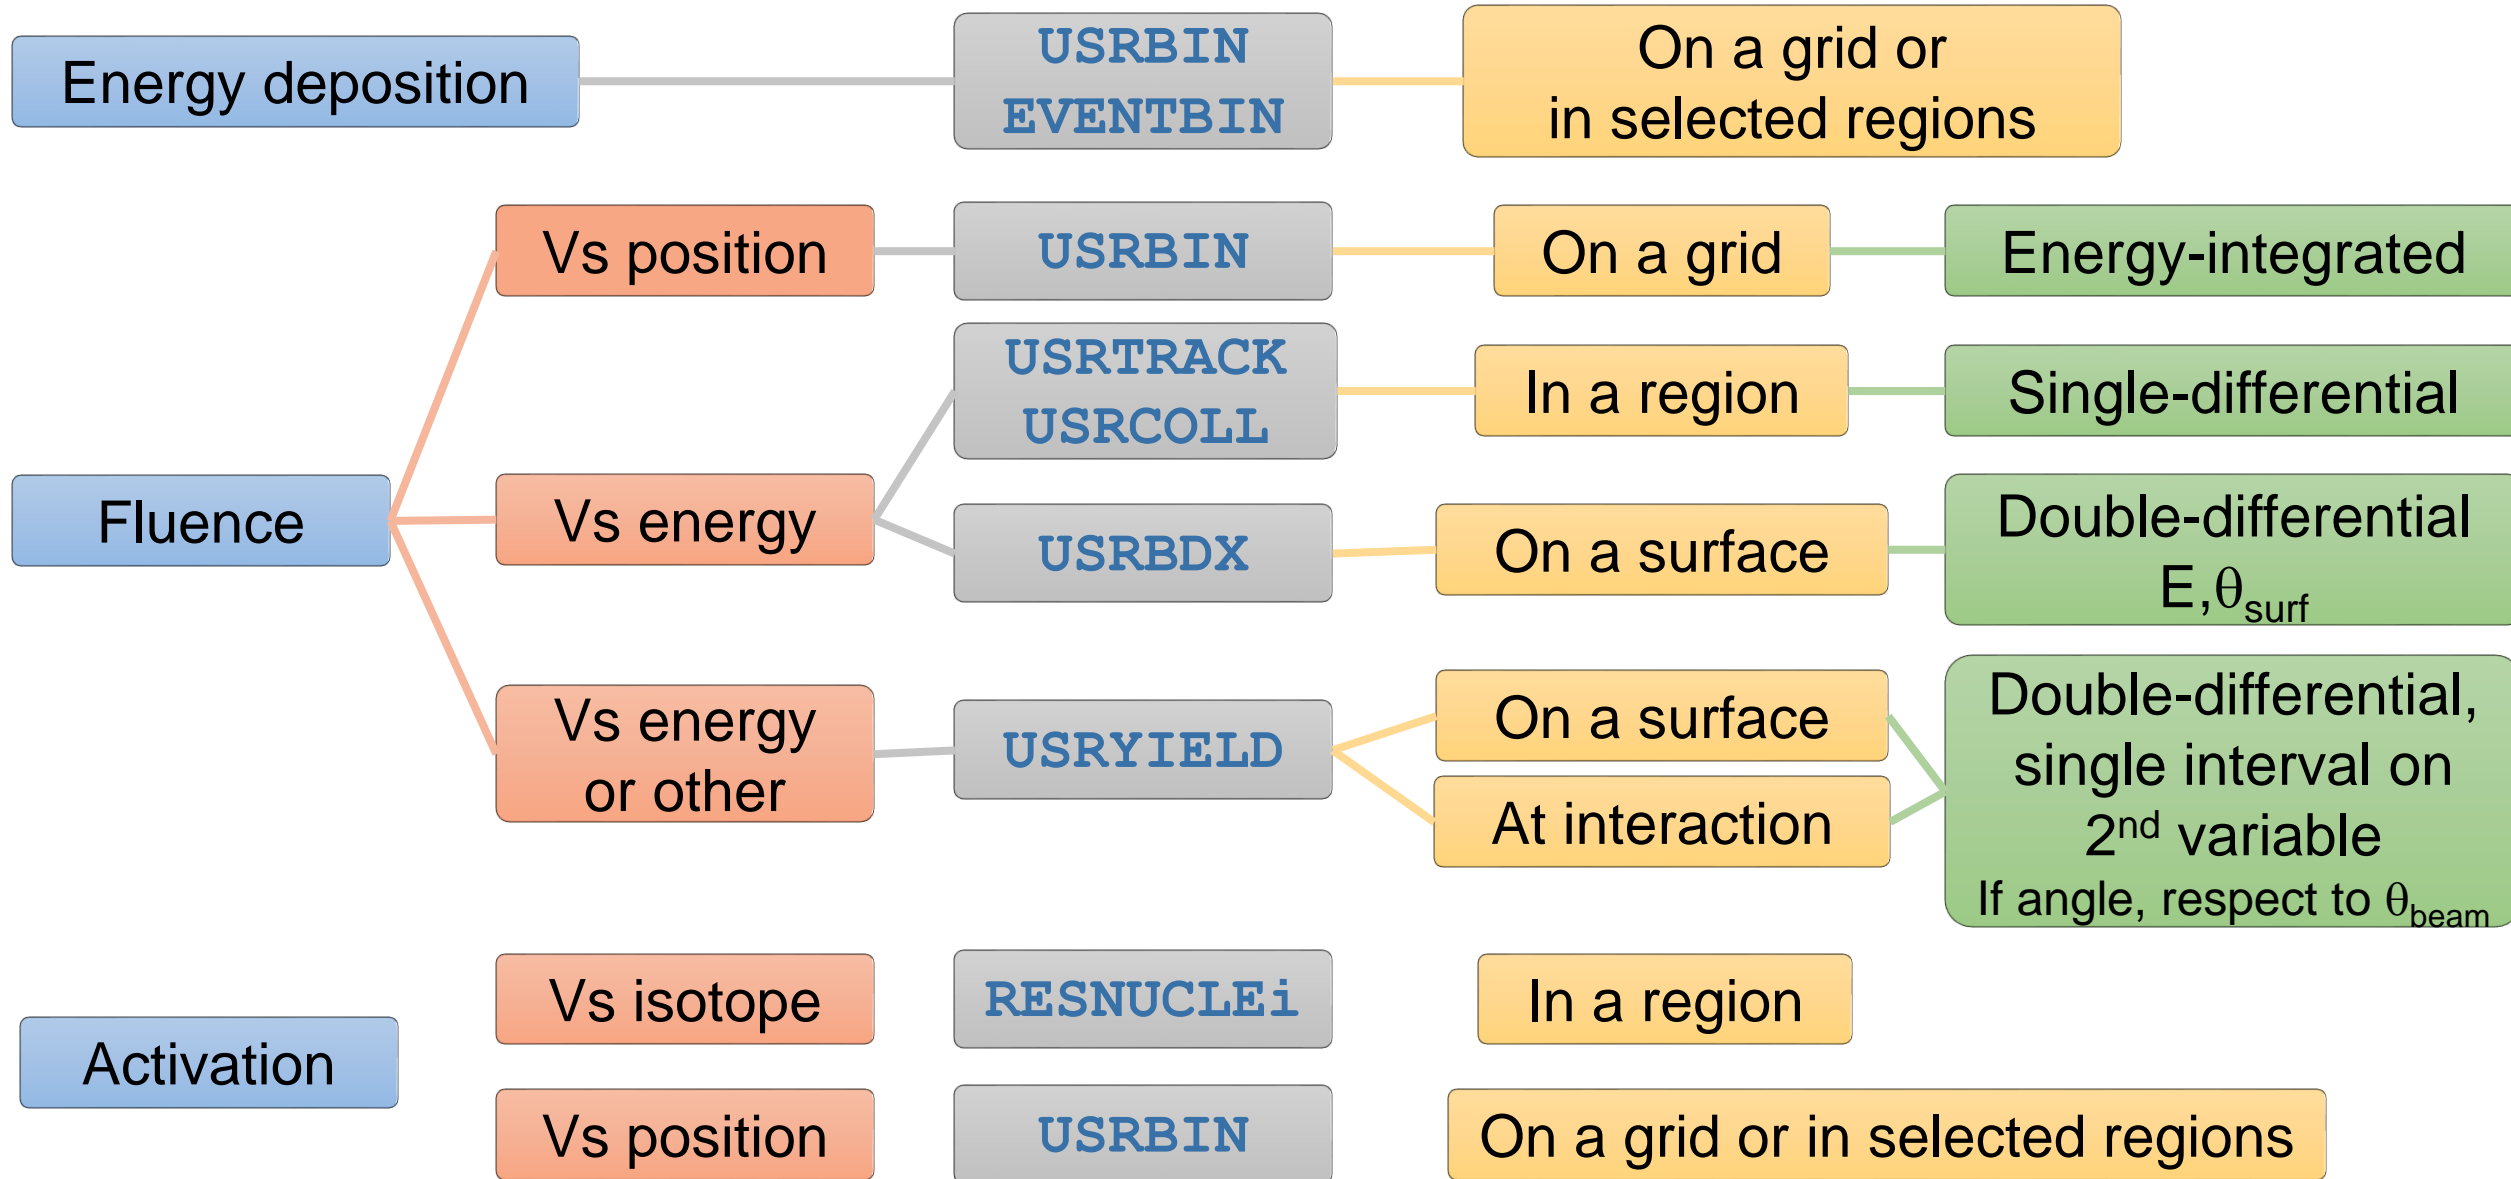

Post-processing utilities (in `/pathtofluka/bin`) merge cycles, calculate average and rms, provide data files for plotting

User code needed

Data merging and plotting available in **Flair**

Results normalized
per primary

FLUKA estimator zoo

Main FLUKA estimators

- **USRBIN** scores the **spatial distribution** of **energy density** or **fluence** (or star density) in a **regular mesh** (cylindrical, Cartesian, or by region) described by the user
- **USRBDX** scores average **$d^2\Phi/dEd\Omega$ (double-differential fluence or current)** of a given type or family of particles on a **given surface**
- **USRTRACK** (**USRCOLL**) scores average **$d\Phi/dE$ (differential fluence)** of a given type or family of particles in a **given region**
- **USRYIELD** scores a **double differential yield** of particles on a **given surface**
 - The distribution can be with respect to energy and angle, but also other more “exotic” quantities
- All scorings write their results into **logical output units assigned by the user**
 - the unit numbers must be **>20**
 - The only exception is **SCORE** – which scores **energy deposition** (or number of stars) in all regions – whose output is printed in the **standard output**

More “Special” Scoring

- **RESNUCLEi** scores **stopping nuclei in a given region**
(more details are given in the respective lecture on activation)
- **DETECT** scores **energy deposition in coincidence** or anti-coincidence with a trigger, separately for each “event” (primary history)
- **EVENTBIN** is like **USRBIN**, but prints the binning output **after each event** instead of an average over histories
- **ROTPRBIN** sets the **storage precision** (single or double) and assigns **rotations/translations** for a given user-defined binning (**USRBIN** or **EVENTBIN**).
Useful in case of **LATTICES**
- **TCQUENCH** sets scoring **time cut-offs and/or Birks quenching** parameters for binnings (**USRBIN** or **EVENTBIN**) indicated by the user
- **USERDUMP** defines the events to be written onto a “**collision tape**” file
- **AUXSCORE** defines **filters** and **conversion coefficients**
- **DCYSCORE** assigns cooling times (see lecture on activation)

Standard Postprocessing Programs

- To analyse the results of the different scoring options, several programs are made available
- The executables are in `/pathtofluka/bin`, while the sources are available in `/pathtofluka/src/tools` in case modifications are needed
- They assume that the estimator files are unformatted, and can calculate standard deviations and average values over many cycles:
 - `ustsuw.f` to analyze `USRTRACK` and `USRCOLL` outputs
 - `usxsuw.f` to analyze `USRBDX` outputs
 - `usysuw.f` to analyze `USRYIELD` outputs
 - `usbsuw.f` to analyze `USRBIN` outputs
 - `usrsuw.f` to analyze `RESNUCLEi` outputs
 - `usbreaf.f` to convert `USRBIN` outputs to ASCII file
- **Behind the scene, Flair uses these programs**

USRBIN scoring definition (3D mesh)

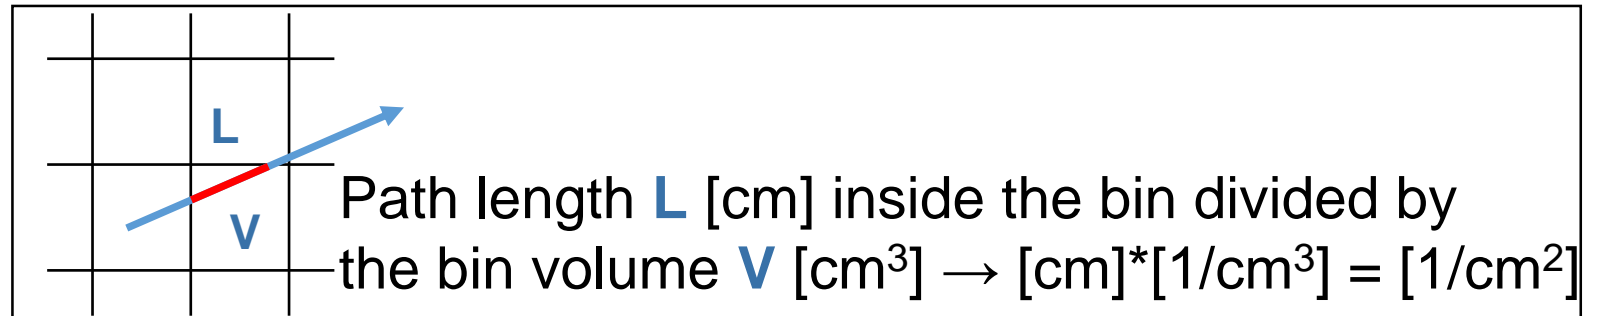

Energy deposition density
(GeV/cm³ per primary)

Particle fluence
(1/cm² per primary)

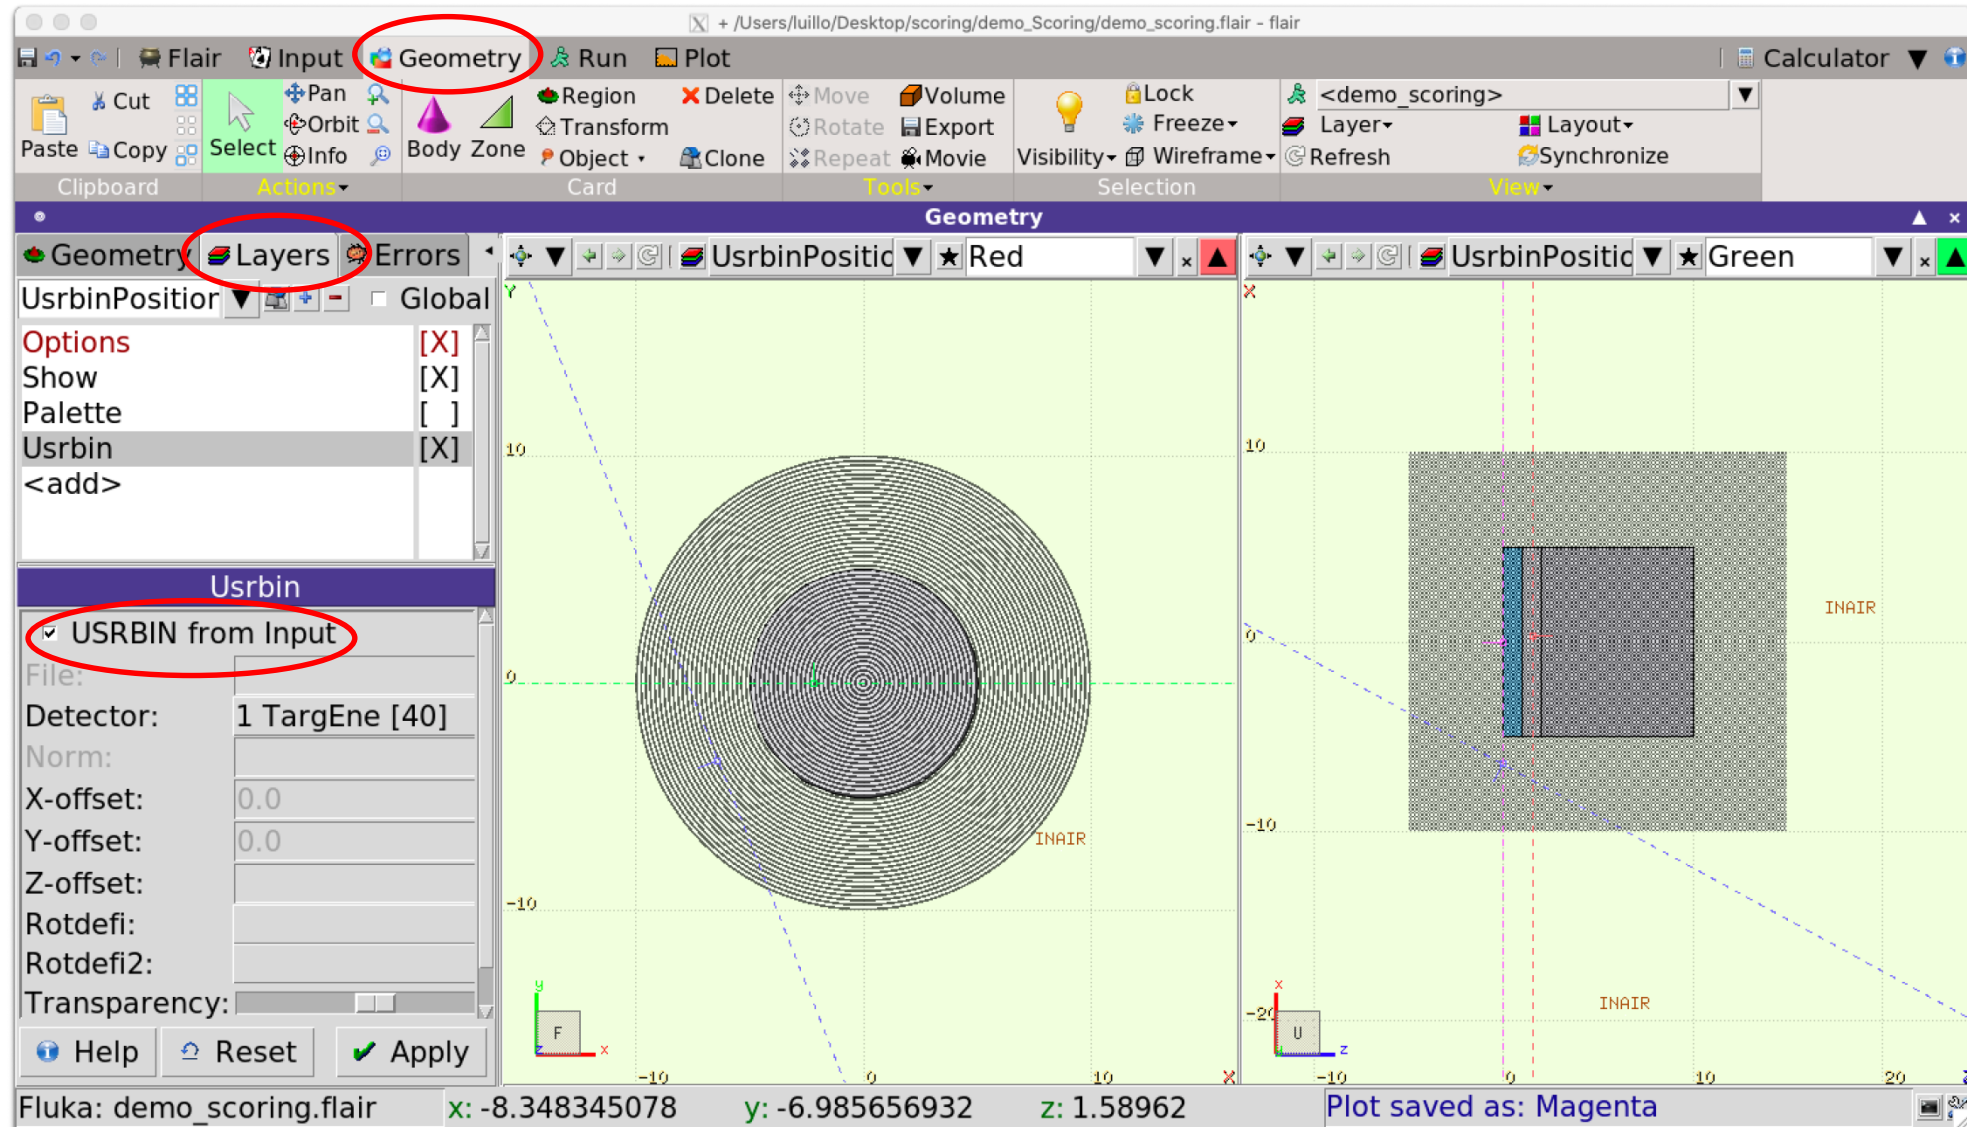

Scoring

target: energy deposition and fluence

USRBIN scoring check (3D mesh)

Plotting – charged hadron fluence (USRBIN mesh)

The screenshot shows the FLUKA Plot window with the following configuration:

- Title:** Charged hadron fluence
- Display:** 1
- Plot range:** (indicated by a blue label)
- Axes:**
 - Label: x: z [cm], y: r [cm], cb: cm⁻² per proton
 - Log: ☐ (for x, y) and ☒ (for cb)
 - Min/Max: (empty fields)
- Binning Detector:**
 - File: demo_scoring_40.bnn
 - Title: FLUKA Course Exercise
 - Cycles: 3 Primaries: 3000 Weight: 3000.0 Time: ***** Sum file *****
- Binning Info:**
 - Det: 2 TargChH (circled in red)
 - R: [0 .. 10] x 100 (0.1)
 - Φ: [-3.14159 .. 3.14159] x 1 (6.28319)
 - Z: [-5 .. 15] x 200 (0.1)
 - Min: 8.74560655E-08
 - Max: 32.4327736
 - Int: 20.874029338185249
- Projection & Limits:**
 - Projection: R, Φ, Z (circled in red)
 - Norm: (empty field)
 - Type: 2D Projection (circled in red)
 - Geometry: (empty field)
 - Use: Auto-
 - Pos: (empty field)
 - Axes: Auto
- Code:**

```
set format cb '10^{%T}'  
set cblabel offset 5
```
- Status:** Fluka: demo_scoring.flair Plot completed

Annotations in the image include:

- Merged file:** points to the file name 'demo_scoring_40.bnn'.
- Mesh summary:** points to the 'Binning Info' section.
- Detector from file:** points to the 'Det: 2 TargChH' entry.
- Type of plot:** points to the 'Type: 2D Projection' entry.

Plot result – charged hadron fluence (USRBIN mesh)

This plot is a **2D projection** of a 3D structure → the result is the **average** over the 3rd coordinate
Projection limits can be set in Flair

Plotting – energy deposition density (USRBIN mesh)

The screenshot shows the FLUKA Plot window with the following settings and annotations:

- Plot Title:** Energy deposition density
- Plot range:** Min: 1e-10, Max: -1 (Log scale)
- Merged file:** demo_scoring_40.bnn
- Mesh summary:** Min: 1.69457832E-13, Max: 0.737646878, Int: 0.41019265039375546
- Detector from file:** 1 TargEne
- Type of plot:** 2D Projection
- Projection & Limits:** R: 1 to 10, Φ : 1 to 15, Z: 1 to 15
- Norm:** set format cb '10^{%T}', set clabel offset 2

Annotations in the image include red circles around the 'Plot' button, 'TargEne' detector, '1 TargEne' in the Binning Info section, and the 'Type: 2D Projection' dropdown. Red arrows point from the 'Type of plot' label to the 'Type: 2D Projection' dropdown and from the 'Detector from file' label to the '1 TargEne' detector.

Plot result – energy deposition density (USRBIN mesh)

This plot is a **2D projection** of a 3D structure → the result is the **average** over the 3rd coordinate
Projection limits can be set in Flair

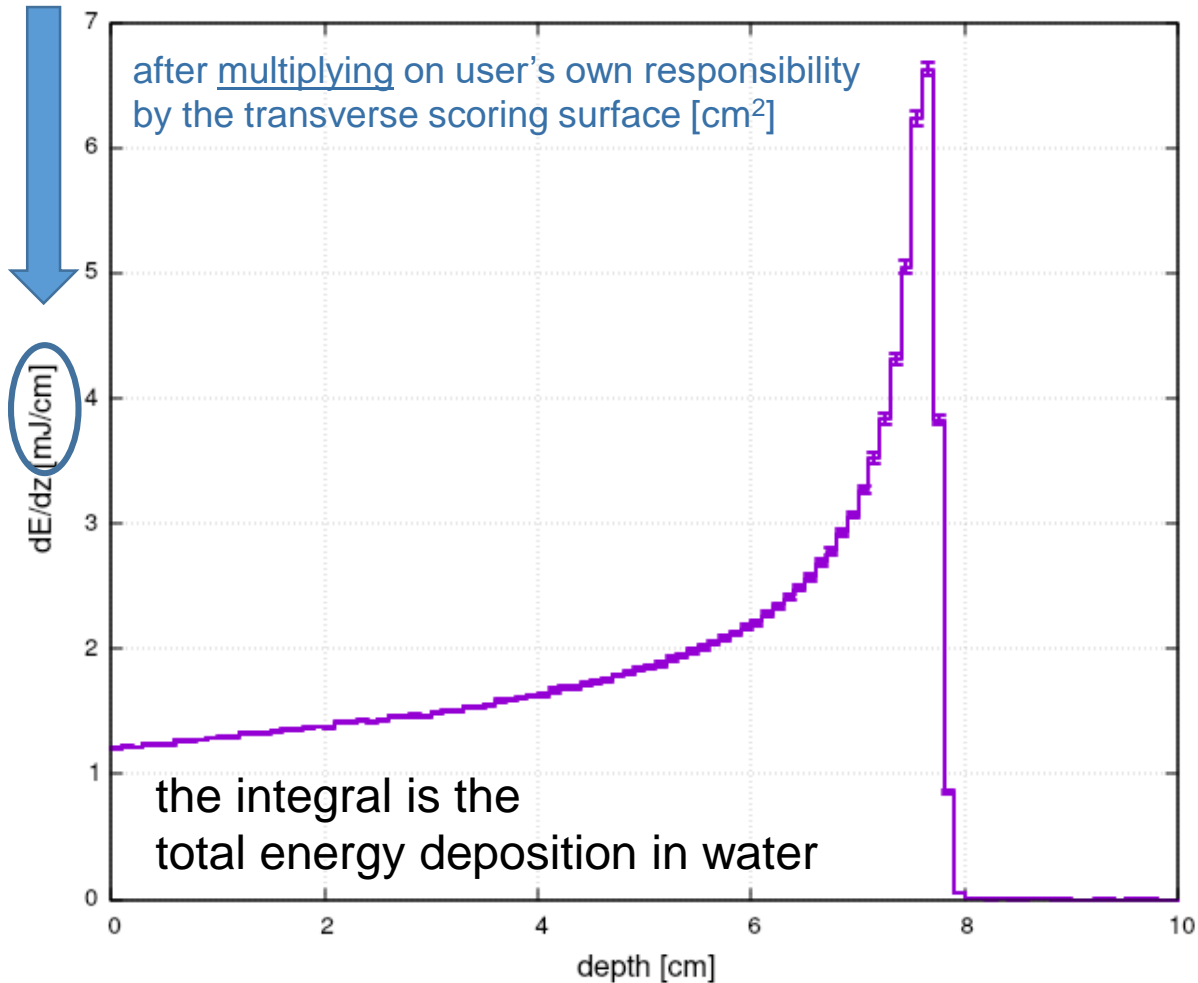

Volume normalization

- FLUKA does not calculate **region** volumes.
- As scoring particle *fluence* (e.g. NEUTRON) or *energy density* (ENERGY) with **USRBIN by region**, the actual results will give instead *tracklength and total energy deposition*, respectively, which differ from the intended quantities by the region volume.
- Conversely, as **USRBIN** scoring **on regular (Cartesian, cylindrical) grids** is requested, *particle fluence and energy density* will be automatically provided, since FLUKA performs the bin volume normalization.

One dimensional plots!

1D Projection

100 MeV protons on water ($I=10^9$)

for each z-bin, the highest value on the transverse scoring surface

1D Max

100 MeV protons on water ($I=10^9$)

Superimposing USRBIN on 3D geometry
